

User Flow Task Flow

Flow Chart

A flowchart is a diagram that “flows out” the sequence of movements and/or actions the user takes within a complex system.

User Flow

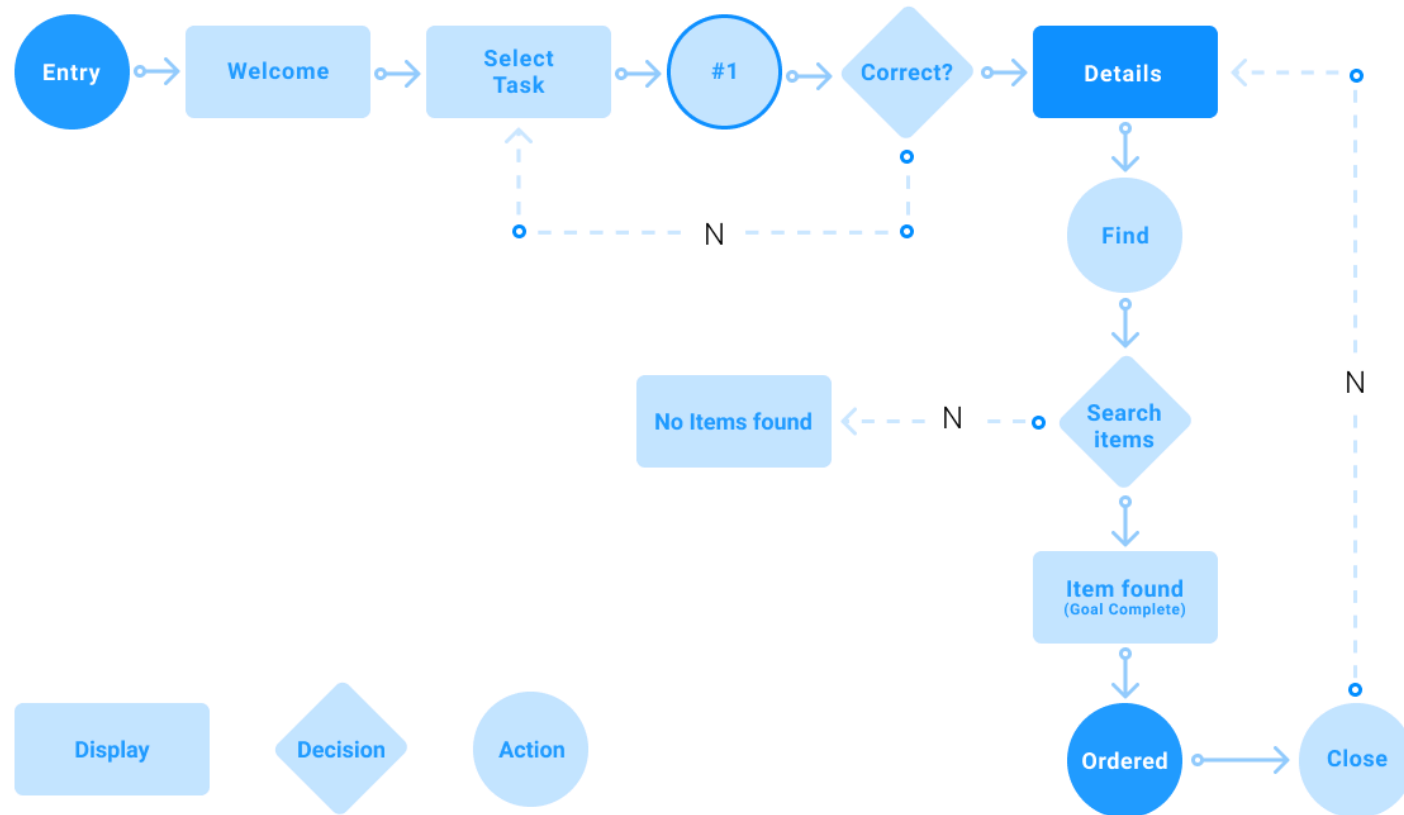

Similar to a flow chart, the point of user flows and task flows is to create experiences that allow users to accomplish a task as quickly and easily as possible.

A user flow is a path the user follows through a product that includes their decision points. The difference here is that a user flow can start off pretty simply to determine key user journeys but can easily evolve into more complex flows by adding all of the many decisions a user can make.

It is very useful for adding edge cases and decisions a user takes that drastically change the course of the flow.

User Flow Example

Important – Multiple paths with decisions

Task Flow

A task flow is different from a user flow in that it is more focused on a specific task, whereas a user flow is more focused on a specific user.

A task flow focuses on accomplishing a very specific task at a high level such as signing up for a service or adding an item to the user's cart. Task flows don't usually branch out and are meant to be more linear and simple.

Task flows can be especially helpful after looking through data analytics and seeing users are experiencing issues completing specific tasks.

Task Flow Example

Important – Sequential path

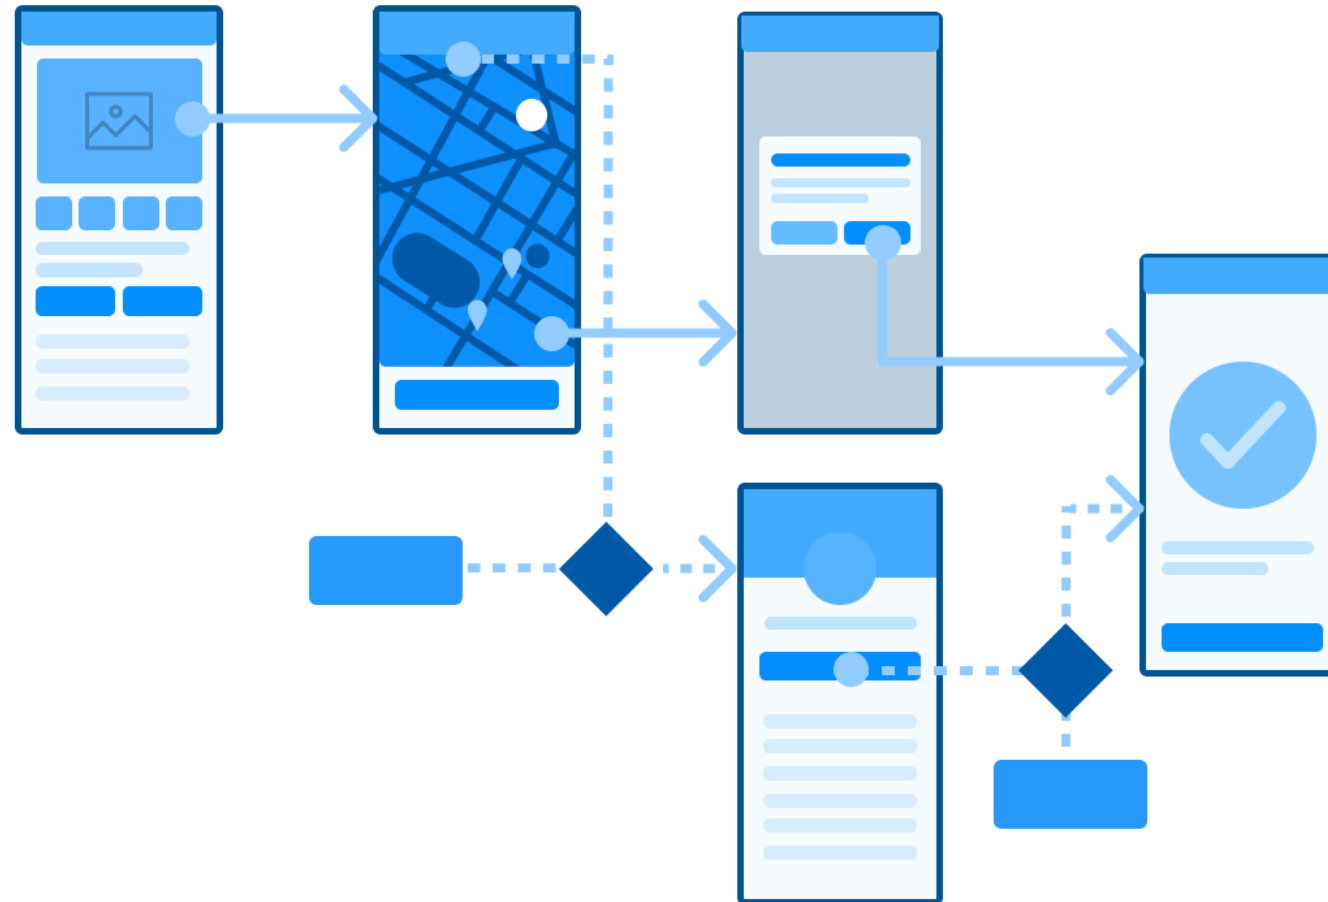

Task Flow Model

A task model is a diagram of the steps people go through, and the decisions they make along the way, to accomplish a specific task.

Task model diagrams document users' decision-making processes, and are therefore particularly useful for ecommerce websites.

Task Flow Model Example

Thank you.
